D-LINK Empowers Users With D-Link Cloud Initiative

D-Link introduces its D-Link Cloud product line, marking a groundbreaking commitment to enhance its numerous consumer networking products with fresh and innovative cloud functionality. The new cloud capabilities will result in improved usability and effortless setup for many popular D-Link devices including network cameras, routers, and storage devices. These functions will be made accessible via the mylink website or mydlink mobile application.

Market research firm Gartner recently confirmed that the era of the 'personal cloud' has arrived. 'We're entering a new era of the personal cloud, which is becoming the center of people's digital lives', said Angela McIntyre, in Gartner's October 27th, 2011 webinar titled iPad and Beyond: What the future of computing holds. Subsequently, D-Link foresees that as users become more mobile thanks to expanded wireless connectivity, they need a convenient way to explore their home networks and content from anywhere. D-Link Cloud is D-Link's solution to this need.

'Creative, fun-loving users want to experience the most from their D-Link products', said Roger Kao, D-Link Chairman and CEO.

Oracle Announces The Availability of OCSAM

On March 22 last Oracle has announced here in Dhaka the availability of Oracle Communications Service Availability Machine (OCSAM), an optimized hardware and software solution that enables network equipment providers (NEPs) to quickly deliver 'zero downtime' applications – such as IPTV, Policy Control, Charging, etc – to communications service providers (CSPs).

The rapid growth of mobile broadband services, proliferation of smartphones and demand for rich media applications has significantly increased the need for application platforms that can provide unprecedented levels of high availability with session integrity. Until now, NEPs have had to custom build these capabilities into each application, slowing time-to-market and increasing project risk. With Oracle Communications Service Availability Machine, NEPs can now focus their resources on building innovative applications by leveraging Oracle's productized service availability capabilities.

Network equipment providers can use Oracle Communications Service Availability Machine's out-of-the-box development environment and standardized hardware and software infrastructure to more efficiently create and deploy innovative, highly-available applications to CSPs, accelerating time-to-revenue while reducing project risk.

Oracle Communications Service Availability Machine includes Oracle Communications Service Availability software – acquired through Oracle's acquisition of GoAhead Software in September 2011 – with initial availability on Oracle's Sun Netra 6000 and Oracle Linux. Oracle Communications Service Availability Machine integrates Oracle's carrier-grade hardware leadership with GoAhead's proven service availability software and expertise. This new approach helps reduce project risk and ensure predictability when creating next-generation applications and services. »

STBL Releases HP Envy 15 Notebook PC in Bangladesh

Smart Technologies BD Limited (STBL) introduced the redesigned HP ENVY 15 notebook PC in Bangladesh that marries performance and advanced technologies with precision craftsmanship, while allowing for the touch of luxury.

Featuring a clean and definitive geometric design, the essence of the new HP ENVY15 lies in the details and craftsmanship. The notebook sports an all-metal chassis with rounded edges in a classic black and silver finish, and accented by subtle red details.

Users can elevate their Windows experience with quicker boot-up with as fast as 21 seconds, turn on the sleep mode in as little as 3 seconds, and resume work in as little as 1 second.

Integrated into the new HP ENVY15, HP Wireless Audio transforms the notebook into a full home audio system. It allows users to stream high-quality audio to up to four external devices or directly to any Klear Net device. Advanced tri-band connectivity reduces interference, lag time and latency for the highest sound quality. HP Wireless Audio streams sound—music, movies or games—up to 30m in any direction.
